

Monday: Project Week Objectives

Introduction

The past few weeks we have learnt a lot. We have learnt on:

1. Proper application structure.
2. Creating a virtual environment.
3. Working with views and templates.
4. Working with models.
5. Unittesting.
6. Object Oriented programming in python.
7. Working with databases.
8. Using extensions to customize our application

We can now test that knowledge by creating a series of projects that you and your pair can tackle. Take each project as if it was given by a **real client** and work with your pair to complete it in a **professional** manner.

You will be given a set of two optional Projects. You and your pair can pick one that you can complete. Every Morning You and your pair will have to present the project to your class during standup

Independent Project Objectives

Your Independent Project at the end of the week will be evaluated on the following objectives:

1. Your project should have a functioning authentication system
2. Your project should contain migration files for the different model structure
3. Your project must have a user model
4. Your project should consume a quotes API
5. Your project should have a comment model
6. Your project should have a profile page.
